Last Time

Functional programming history

- Church & the lambda calculus
- Scheme
- ML (OCaml)
- Modern times: F#, Clojure, Scala, Map Reduce, ...

<https://powcoder.com>

OCaml

- Functional language, gets most work done by analyzing old data and producing *new, immutable* data
- Simple, typed programming language based on the lambda calculus
- Immutable data is the default; mutable data is possible (imperative, object-oriented)

Type Checking

- Every value has a type and so does every expression
- This is a concept that is familiar from Java but it becomes more important when programming in a functional language
- The type of an expression is determined by the type of its subexpressions
- We write $(e : t)$ to say that expression e has type t . eg:

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

$2 : \text{int}$

$\text{"hello"} : \text{string}$

$2 + 2 : \text{int}$

$\text{"I say " ^ "hello"} : \text{string}$

Type Checking Rules

- There are a set of **simple rules** that govern type checking
 - programs that do not follow the rules will not type check and OCaml will refuse to compile them for you (the nerve!)
 - at first you may find this to be a pain ...

Assignment Project Exam Help

- But types are a great thing:
 - they *help us think* about how to construct our programs
 - they help us *find stupid programming errors*
 - they help us track down compatibility errors quickly when we edit and *maintain our code*
 - they allow us to *enforce powerful invariants* about our data structures

<https://powcoder.com>

Add WeChat powcoder

Type Checking Rules

- Example rules:

(1) `0 : int` (and similarly for any other integer constant n)

(2) `"abc" : string` (and similarly for any other string constant "...")

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Type Checking Rules

- Example rules:

(1) $0 : \text{int}$ (and similarly for any other integer constant n)

(2) $"abc" : \text{string}$ (and similarly for any other string constant "...")

Assignment Project Exam Help

(3) if $e1 : \text{int}$ and $e2 : \text{int}$ then $e1 + e2 : \text{int}$ (4) if $e1 : \text{int}$ and $e2 : \text{int}$ then $e1 * e2 : \text{int}$

<https://powcoder.com>
Add WeChat powcoder

Type Checking Rules

- Example rules:

(1) $0 : \text{int}$ (and similarly for any other integer constant n)

(2) $"abc" : \text{string}$ (and similarly for any other string constant "...")

Assignment Project Exam Help

(3) if $e1 : \text{int}$ and $e2 : \text{int}$ then $e1 + e2 : \text{int}$ (4) if $e1 : \text{int}$ and $e2 : \text{int}$ then $e1 * e2 : \text{int}$

<https://powcoder.com>

(5) if $e1 : \text{string}$ and $e2 : \text{string}$ then $e1 \wedge e2 : \text{string}$ (6) if $e : \text{int}$ then $\text{string_of_int } e : \text{string}$

Add WeChat powcoder

Type Checking Rules

- Example rules:

(1) $0 : \text{int}$ (and similarly for any other integer constant n)

(2) $"\text{abc}" : \text{string}$ (and similarly for any other string constant "...")

Assignment Project Exam Help

(3) if $e1 : \text{int}$ and $e2 : \text{int}$ then $e1 + e2 : \text{int}$ (4) if $e1 : \text{int}$ and $e2 : \text{int}$ then $e1 * e2 : \text{int}$

<https://powcoder.com>

(5) if $e1 : \text{string}$ and $e2 : \text{string}$ then $e1 \wedge e2 : \text{string}$ (6) if $e : \text{int}$ then $\text{string_of_int } e : \text{string}$

Add WeChat powcoder

- Using the rules:

$2 : \text{int}$ and $3 : \text{int}$. (By rule 1)

Type Checking Rules

- Example rules:

(1) $0 : \text{int}$ (and similarly for any other integer constant n)

(2) $"\text{abc}" : \text{string}$ (and similarly for any other string constant "...")

Assignment Project Exam Help

(3) if $e1 : \text{int}$ and $e2 : \text{int}$ then $e1 + e2 : \text{int}$ (4) if $e1 : \text{int}$ and $e2 : \text{int}$ then $e1 * e2 : \text{int}$

(5) if $e1 : \text{string}$ and $e2 : \text{string}$ then $e1 \wedge e2 : \text{string}$ (6) if $e : \text{int}$ then $\text{string_of_int } e : \text{string}$

- Using the rules:

$2 : \text{int}$ and $3 : \text{int}$. (By rule 1)

Therefore, $(2 + 3) : \text{int}$ (By rule 3)

Type Checking Rules

- Example rules:

(1) $0 : \text{int}$ (and similarly for any other integer constant n)

(2) $"abc" : \text{string}$ (and similarly for any other string constant "...")

Assignment Project Exam Help

(3) if $e1 : \text{int}$ and $e2 : \text{int}$ then $e1 + e2 : \text{int}$ (4) if $e1 : \text{int}$ and $e2 : \text{int}$ then $e1 * e2 : \text{int}$

(5) if $e1 : \text{string}$ and $e2 : \text{string}$ then $e1 \wedge e2 : \text{string}$ (6) if $e : \text{int}$ then $\text{string_of_int } e : \text{string}$

- Using the rules:

$2 : \text{int}$ and $3 : \text{int}$. (By rule 1)

Therefore, $(2 + 3) : \text{int}$ (By rule 3)

$5 : \text{int}$ (By rule 1)

Type Checking Rules

- Example rules:

(1) $0 : \text{int}$ (and similarly for any other integer constant n)

(2) $"\text{abc}" : \text{string}$ (and similarly for any other string constant s)

(3) if $e1 : \text{int}$ and $e2 : \text{int}$
then $e1 + e2 : \text{int}$

(5) if $e1 : \text{string}$ and $e2 : \text{string}$
then $e1 \wedge e2 : \text{string}$

- Using the rules:

$2 : \text{int}$ and $3 : \text{int}$. (By rule 1)

Therefore, $(2 + 3) : \text{int}$ (By rule 3)

$5 : \text{int}$ (By rule 1)

Therefore, $(2 + 3) * 5 : \text{int}$ (By rule 4 and our previous work)

Assignment Project Exam Help

FYI: This is a *formal proof*
that the expression is well-
typed!

Type Checking Rules

- Example rules:

(1) $0 : \text{int}$ (and similarly for any other integer constant n)

(2) $"\text{abc}" : \text{string}$ (and similarly for any other string constant "...")

Assignment Project Exam Help

(3) if $e1 : \text{int}$ and $e2 : \text{int}$ then $e1 + e2 : \text{int}$ (4) if $e1 : \text{int}$ and $e2 : \text{int}$ then $e1 * e2 : \text{int}$

(5) if $e1 : \text{string}$ and $e2 : \text{string}$ then $e1 \wedge e2 : \text{string}$ (6) if $e : \text{int}$ then $\text{string_of_int } e : \text{string}$

- Violating the rules:

$"\text{hello}" : \text{string}$

$1 : \text{int}$

$1 + "\text{hello}" : ??$

(By rule 2)

(By rule 1)

(NO TYPE! Rule 3 does not apply!)

Type Checking Rules

- Violating the rules:

```
# "hello" + 1;;
```

Error: This expression has type string but an
expression was expected of type int

Assignment Project Exam Help

<https://powcoder.com>

- The type error message tells you the type that was **expected** and the type that it **inferred** for your subexpression
- By the way, this was one of the nonsensical expressions that did not evaluate to a value
- It is a **good thing** that this expression does not type check!

“Well typed programs do not go wrong”

Robin Milner, 1978

Type Checking Rules

- Violating the rules:

```
# "hello" + 1;;
```

Error: This expression has type string but an expression was expected of type int

Assignment Project Exam Help

<https://powcoder.com>

- A possible fix:

Add WeChat powcoder

```
# "hello" ^ (string_of_int 1);;  
- : string = "hello1"
```

- One of the keys to becoming a good ML programmer is to understand type error messages.*

Example Type-checking Rules

if $e1 : \text{bool}$
and $e2 : t$ and $e3 : t$ (the same type t , for some type t)
then if $e1$ then $e2$ else $e3 : t$ (that same type t)

Type Checking Rules

- Type errors for if statements can be confusing sometimes.
Example: We create a string from s, concatenating it n times:

```
let rec concatn s n =  
  if n <= 0 then
```

Assignment Project Exam Help

```
  else
```

```
    s ^ (concatn s (n-1))
```

Add WeChat powcoder

The type checker points to the correct branch as the cause of an error because it does not AGREE with the type of an earlier branch.
Really, the error is in the earlier branch.

Moral: *Sometimes you need to look in an earlier branch for the error*
even though the type checker points to a later branch.
The type checker doesn't know what the user wants.

A Tactic: Add Typing Annotations

```
let rec concatn (s:string) (n:int) : string =  
  if n <= 0 then  
    0  
  else  
    s ^ (concatn s (n-1))
```

EXCEPTIONS:

**DO THEY CAUSE PROGRAMS TO
"GO WRONG"?**

Type Checking Rules

- What about this expression:

```
# 3 / 0 ;;  
Exception: Division_by_zero.
```

- Why doesn't the ML type checker do us the favor of telling us the expression will raise an exception?

<https://powcoder.com>

Add WeChat powcoder

Type Checking Rules

- What about this expression:

```
# 3 / 0 ;;  
Exception: Division_by_zero.
```

- Why doesn't the ML type checker do us the favor of telling us the expression will raise an exception?
<https://powcoder.com>
[Add WeChat powcoder](#)
 - In general, detecting a divide-by-zero error requires we know that the divisor evaluates to 0.
 - In general, deciding whether the divisor evaluates to 0 requires solving the halting problem:

```
# 3 / (if turing_machine_halts m then 0 else 1) ;;
```

- There are type systems that will rule out divide-by-zero errors, but they require programmers to supply proofs to the type checker

Isn't that cheating?

“Well typed programs do not go wrong”

Robin Milner, 1978

(3 / 0) is well typed. Does it “go wrong?” Answer: No.

Assignment Project Exam Help

“Go wrong” is a technical term meaning “have no defined semantics.” Raising an exception is perfectly well defined semantics, which we can reason about, which we can handle in ML with an exception handler.

So, it's not cheating.

Type Soundness

“Well typed programs do not go wrong”

Programming languages with this property have *sound* type systems. They are called *safe* languages.

Assignment Project Exam Help

Safe languages are generally immune to buffer overrun vulnerabilities, uninitialized pointer vulnerabilities, etc. (but not immune to all bugs!)

<https://powcoder.com>

Add WeChat powcoder

Safe languages: ML, Java, Python, ...

Unsafe languages: C, C++, Pascal

Well typed programs do not go wrong

Robin Milner

Turing Award, 1991

“For three distinct and complete achievements:

1. **LCF**, the mechanization of Scott's Logic of Computable Functions, probably the first theoretically based yet practical tool for machine assisted proof construction;

2. **ML**, the first language to include polymorphic type inference together with a type-safe exception-handling mechanism;

3. **CCS**, a general theory of concurrency.

In addition, he formulated and strongly advanced full abstraction, the study of the relationship between operational and denotational semantics.”

“Well typed programs do not go wrong”

Robin Milner, 1978

SUMMARY

OCaml

OCaml is a *functional* programming language

- Java gets most work done by *modifying* data
- OCaml gets most work done by producing *new, immutable* data

Assignment Project Exam Help

OCaml is a *typed* programming language

- the *type* of an expression *correctly predicts* the kind of *value* the expression will generate when it is executed
- there are systematic rules defining when any expression (or program) type checks
 - these rules actually form a formal logic ... it is not a coincidence that languages like ML are used inside theorem provers
- the type system is *sound*; the language is *safe*
